*TP-Link routers are popular for their reliability and affordability, but like any networking device, they can sometimes face connectivity problems. If your TP-Link router won't connect to the internet or shows as connected but no internet, you're not alone. Many users experience these issues, and there are several reasons and solutions to address them.*

*Whether you're facing a TP-Link router not connecting during setup, or you've been using it for some time and suddenly experience disconnections, the steps outlined here will help resolve these problems. In this article, we'll go over the common causes and provide detailed troubleshooting tips to help you restore your internet connection.*

*Common Reasons for TP-Link Router Connectivity Issues*

*Before diving into solutions, it's helpful to understand why your TP-Link router is not connecting to the internet or why it may display the dreaded "connected without internet" message. Here are some common reasons behind this issue:*

- 1. Incorrect Setup: During the initial setup of your TP-Link router, an incorrect configuration can result in your TP-Link not connecting to the internet.*
- 2. ISP Issues: Sometimes, the issue lies with your Internet Service Provider (ISP) rather than the router itself. If there's an outage or network maintenance, your TP-Link router connected but no internet could simply mean your ISP is at fault.*
- 3. Faulty Cables: A damaged Ethernet cable or loose connection can cause your TP-Link router to not connect to the internet.*
- 4. Wrong Network Settings: Incorrect DNS or IP address settings can also cause your TP-Link router to show connected without internet.*
- 5. Firmware Issues: Outdated firmware can create connectivity problems where your TP-Link router won't connect to the internet or has a weak connection.*
- 6. Overloaded Network: Too many devices connected to your network at once can overload the router, leading to disconnections or no internet access.*
- 7. ISP Modem Issues: Sometimes, the problem is not with the router but with the modem provided by your ISP. If the modem isn't functioning properly, it can prevent the router from connecting to the internet.*
